## Food Price Index: May 2010

### Highlights

In May 2010 compared with April 2010:

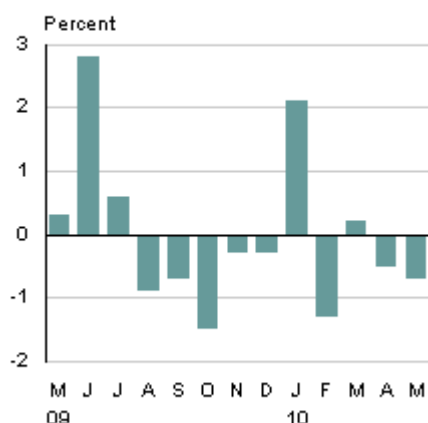

- Food prices fell 0.7 percent.
- Meat, poultry, and fish prices fell 2.4 percent.
- Grocery food prices fell 0.7 percent.
- Fruit and vegetables prices fell 2.1 percent.
- Restaurant meals and ready-to-eat food prices rose 0.3 percent.
- Non-alcoholic beverage prices rose 1.5 percent.

From May 2009 to May 2010:

- Food prices decreased 0.5 percent. This is the first annual fall in food prices since the year to July 2004.

## Food prices in May 2010

Food prices decreased 0.7 percent in May 2010, following a decrease of 0.5 percent in April and an increase of 0.2 percent in March. Prices are at their lowest level since 2008, and are 3.8 percent below their mid-2009 peak.

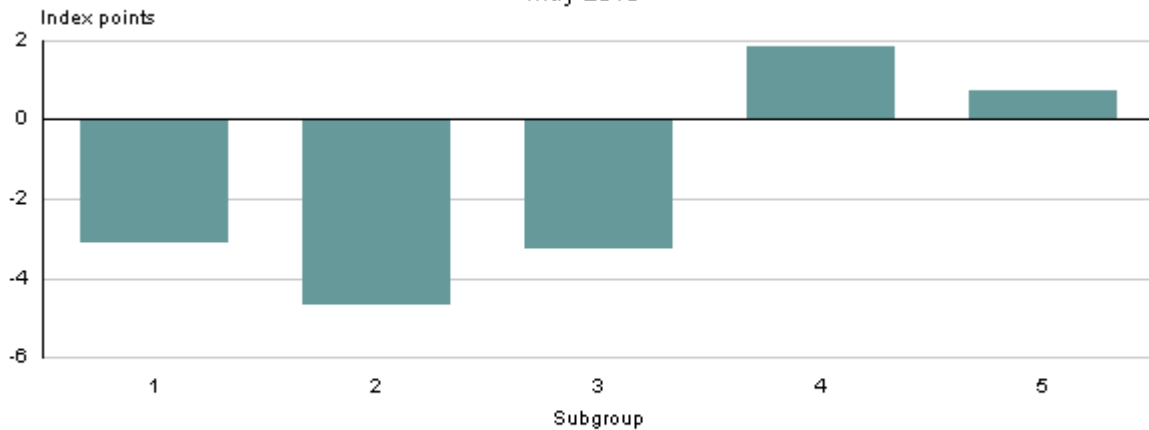

In May 2010, lower prices were recorded for the following subgroups: meat, poultry, and fish (down 2.4 percent), grocery food (down 0.7 percent), and fruit and vegetables (down 2.1 percent). Higher prices were recorded for the non-alcoholic beverages (up 1.5 percent) and restaurant meals and ready-to-eat food (up 0.3 percent) subgroups.

The most significant individual downward contributions came from lower prices for porterhouse/sirloin beef steak (down 16.2 percent), mandarins (down 34.7 percent), fresh chicken (down 5.0 percent), and kiwifruit (down 49.4 percent).

The most significant upward contributions came from higher prices for tomatoes (up 10.6 percent), instant coffee (up 9.8 percent), and plain biscuits (up 10.0 percent).

**Index points contribution to food price index**

May 2010

1 Fruit and vegetables    2 Meat, poultry, and fish    3 Grocery food    4 Non-alcoholic beverages  
5 Restaurant meals and ready-to-eat food

Source: Statistics New Zealand

Monthly index points contribution		
Subgroup	Mar 2010 to Apr 2010	Apr 2010 to May 2010
Fruit and vegetables	-2.67	-3.10
Meat, poultry, and fish	-5.46	-4.68
Grocery food	3.17	-3.28
Non-alcoholic beverages	-0.59	1.81
Restaurant meals and ready-to-eat food	0.01	0.70
<b>Food price index</b>	<b>-5.54</b>	<b>-8.54</b>

**Note:** Index points contributions may not sum to total due to rounding.

## Distribution of item-level movements

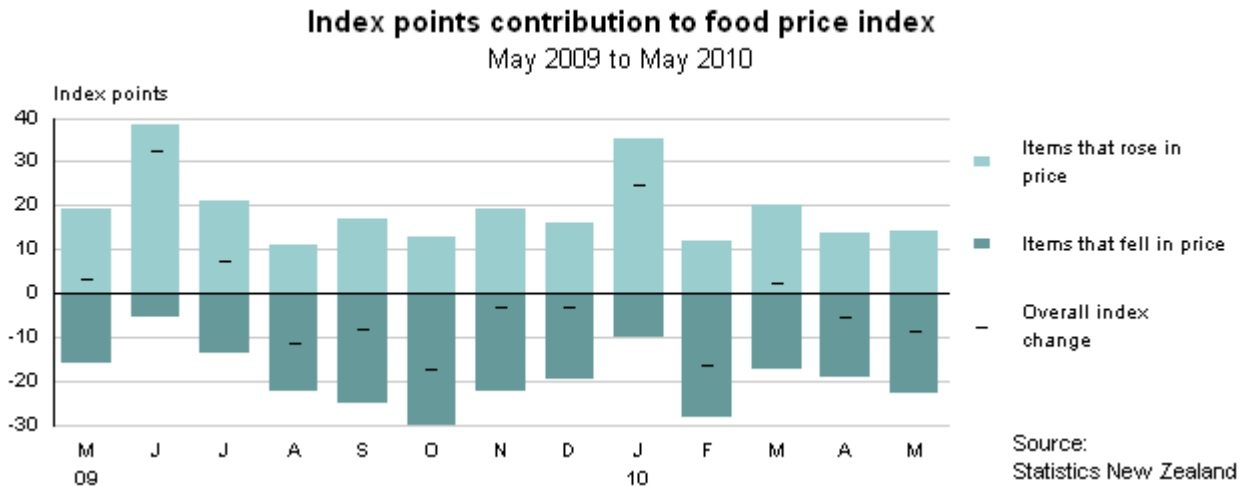

The table below outlines the distribution of price movements in April 2010 and May 2010. The food price index (FPI) has been partitioned into those national item-level indexes that increased, showed no change, or decreased.

Distribution of item-level index movements		
National item-level index movements	Mar 2010 to Apr 2010	Apr 2010 to May 2010
<b>Increase in price</b>		
Number of items	67	71
Percentage of all items	42.7	45.2
Percentage of expenditure weight	43.1	51.4
Index points contribution	13.6	14.2
Weighted average price increase (percent)	2.7	2.3
<b>No change in price</b>		
Number of items	4	4
Percentage of all items	2.5	2.5
Percentage of expenditure weight	1.6	1.1
<b>Decrease in price</b>		
Number of items	86	82
Percentage of all items	54.8	52.2
Percentage of expenditure weight	55.3	47.5
Index points contribution	-19.1	-22.7
Weighted average price decrease (percent)	2.9	4.1

The distribution of item-level movements shows that:

- The weighted average price decrease rose, while the weighted average price increase fell.
- The weighted average price decrease was much larger than the weighted average price increase.

These movements resulted in a 0.7 percent decrease in the May 2010 FPI, following a 0.5 percent decrease in April 2010.

The larger fall this month is due to stronger price falls for the items that decreased in price.

## Annual movements

Food prices decreased 0.5 percent in the year to May 2010, following increases of 0.4 percent and 0.3 percent for the years to April 2010 and March 2010, respectively. The May 2010 annual decrease is the first annual decrease since a 0.1 percent fall in the year to July 2004, and the largest fall since the year to April 2003.

Both the meat, poultry, and fish subgroup and the fruit and vegetables subgroup were down 4.5 percent in the year to May 2010.

The remaining three subgroups recorded annual increases: restaurant meals and ready-to-eat food (up 2.0 percent), non-alcoholic beverages (up 2.4 percent), and grocery food (up 0.5 percent).

The most significant individual downward contributions came from lower prices for fresh chicken (down 11.5 percent), porterhouse/sirloin beef steak (down 10.6 percent), bacon (down 7.4 percent), and bananas (down 9.1 percent).

The most significant individual upward contributions came from higher prices for soft drinks (up 6.8 percent), fresh milk (up 5.1 percent), butter (up 28.9 percent), and cheddar cheese (up 9.9 percent).

<b>Annual index points contribution</b>	
<b>Subgroup</b>	<b>May 2009 to May 2010</b>
Meat, poultry, and fish	-9.20
Fruit and vegetables	-6.90
Grocery food	2.24
Non-alcoholic beverages	2.80
Restaurant meals and ready-to-eat food	4.85
<b>Food price index</b>	<b>-6.21</b>

**Note:** Index points contributions may not sum to total due to rounding.

## Meat, poultry, and fish

Prices for the meat, poultry, and fish subgroup decreased 2.4 percent in May 2010, following a decrease of 2.6 percent in April and an increase of 1.3 percent in March.

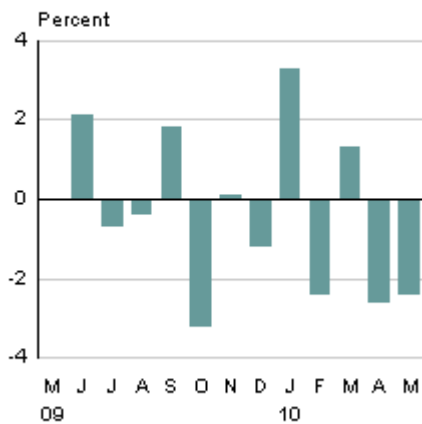

The most significant downward contributions came from porterhouse/sirloin beef steak (down 16.2 percent) and fresh chicken (down 5.0 percent). Both of these items were influenced by discounting, with over half of recorded porterhouse/sirloin beef steak prices on special.

Meat, poultry, and fish prices rose 10.1 percent from July 2008 to December 2008, before peaking in September 2009. Prices in May 2010 returned to levels last recorded in September 2008, and were 7.1 percent lower than their 2009 peak. Prices for fresh chicken peaked in August 2009, and were 13.4 percent below this peak in May 2010.

For the year to May 2010, meat, poultry, and fish prices fell 4.5 percent. This is the biggest annual fall since the year to August 2003. The most significant downward contributions came from lower prices for fresh chicken (down 11.5 percent), porterhouse/sirloin beef steak (down 10.6 percent), and bacon (down 7.4 percent). The most significant individual upward contribution came from higher prices for sausages (up 9.7 percent).

## Grocery food

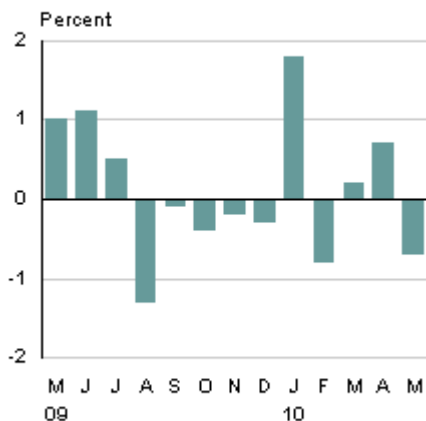

Prices for the grocery food subgroup fell 0.7 percent in May 2010, following increases of 0.7 percent and 0.2 percent in April and March, respectively.

The most significant downward contributions came from lower prices for potato crisps (down 5.8 percent) and chocolate bars and blocks (down 4.4 percent). The most significant upward contribution came from higher prices for plain biscuits (up 10.0 percent), where prices were influenced by discounting in April.

For the year to May 2010, grocery food prices increased 0.5 percent. The most significant upward contributions came from higher prices for fresh milk (up 5.1 percent), butter (up 28.9 percent), and cheddar cheese (up 9.9 percent). Prices for butter have increased strongly over the past five months, by 51.1 percent since December 2009, and are now 3.0 percent above their 2008 peak. Similarly, fresh milk prices are now 6.2 percent higher than December 2009, and 0.6 percent above their 2008 peak, while cheddar cheese prices are now 13.6 percent higher than in December 2009, but 10.3 percent below their 2008 peak.

## Other subgroups

In May 2010, the fruit and vegetables subgroup fell 2.1 percent, while the non-alcoholic beverages subgroup and the restaurant meals and ready-to-eat food subgroup increased 1.5 percent and 0.3 percent, respectively.

Fruit prices decreased 4.5 percent, with lower prices for mandarins (down 34.7 percent) and kiwifruit (down 49.4 percent) reflecting more plentiful supply. Kiwifruit prices can often halve in May and mandarins prices can often fall by over 40 percent.

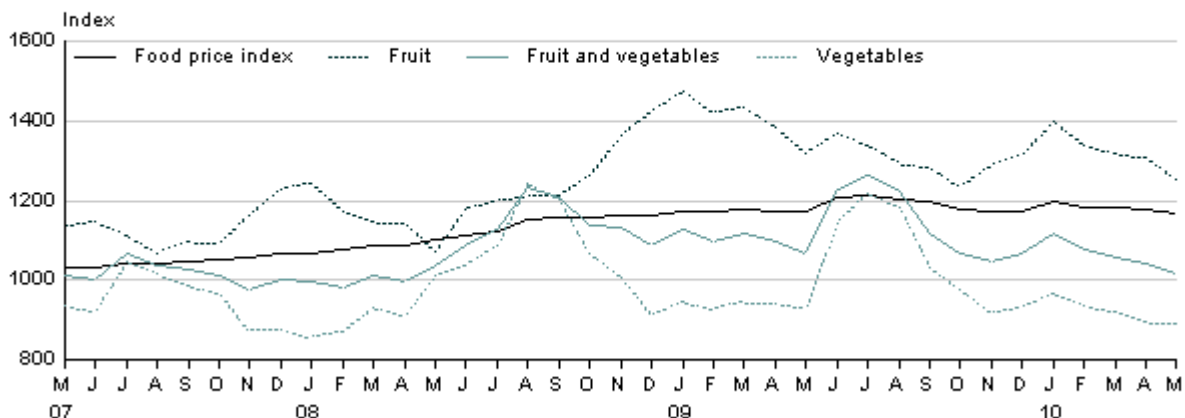

Vegetable prices decreased 0.2 percent. Lower prices were recorded for broccoli (down 23.3 percent) and cauliflower (down 41.2 percent). These price falls were partly offset by higher prices for tomatoes (up 10.6 percent).

Another upward contribution came from higher prices for instant coffee (up 9.8 percent), after significant discounting in April.

## **Changes to the timing of the food price index**

The FPI has usually been released nine working days after the month, except every third month, when it has been released with the quarterly consumers price index (CPI). For example, the March 2010 FPI was released with the March 2010 quarter CPI, 12 working days after the quarter.

Statistics New Zealand has reviewed this practice and in future will release each FPI on the ninth working day after the end of the month.

This change will take place for the June 2010 FPI, which will be released on 13 July. The June 2010 quarter CPI will be released on 16 July.

### **Next release ...**

*Food Price Index: June 2010 will be released on 13 July 2010.*

## Technical notes

### What the food price index measures

The food price index (FPI) measures the rate of price change of food and food services purchased by households. The food group is the only commodity group of the consumers price index (CPI) for which an index is prepared each month. The all groups CPI is prepared quarterly.

### Index series available online from Infoshare

To access more data from the CPI series, go to Infoshare at [www.stats.govt.nz/infoshare](http://www.stats.govt.nz/infoshare), and choose:

Subject category: **Economic indicators**

Group: **Consumers Price Index**

The FPI series are listed immediately after the CPI series.

The time series can be downloaded in Excel or comma delimited format, where percentage movements can be calculated using the following formula:

$$\left( \frac{\text{Index number for later period} - \text{Index number for earlier period}}{\text{Index number for earlier period}} \right) \times 100$$

[More information about Infoshare.](#)

### Distribution of item-level index movements

The Distribution of Item-level Index Movements table in the commentary of this Hot Off the Press gives additional information on the distribution of price movements recorded for the current month's FPI. The analytical statistics in the table give an indication of how widespread price changes are, and their relative magnitude compared with previous months.

### Grocery food specials

Items that are 'on special' or come 'off special' are included in the FPI at the price levels observed at the time prices are collected. An analysis of the price quotes for these items is often given for the grocery food and non-alcoholic beverages subgroups in the commentary of this Hot Off the Press. To be included in this analysis, the priced item will have been on special either last month or this month, or have been on special in both months.

## **Sample of outlets**

Prices are collected from a sample of retail outlets. This sample was selected as part of the 2006 FPI review. The last selection of outlets took place with the 1999 FPI review. As a result of the 2006 FPI review, the price collection effort was redistributed to align more closely with the population shares of the regions. This redistribution means more prices are collected in the larger pricing centres, particularly Auckland. The objective of this re-allocation is to maximise the accuracy of the national FPI while taking into account a secondary requirement to produce regional indexes of good quality.

Food prices are collected from about 650 outlets in the 15 surveyed urban areas. Of these, about 75 are supermarkets, 30 greengrocers, 30 fish shops, 30 butchers, 50 convenience stores (with half being service stations and the other half being dairies, grocery stores, and superettes), 120 restaurants (for evening meals), and more than 300 are other suitable outlets (for breakfast, lunch, and takeaway food).

## **Review of the food price index**

The FPI was reviewed in 2008 as part of the regular review of the consumers price index (CPI). The review encompassed the reselection of the basket of representative food goods and services and the reweighting of the basket to reflect the relative importance of household spending on food.

The item pricing specifications were also updated, and the sample of product sizes, brands, and varieties has been reselected in some cases. Price collectors were also given more guidance about specific brand-share targets for selected goods by using summary information collated from supermarket scan data obtained from the Nielsen Company. The guidance ensures that the mix of brands in the FPI price samples reflect market shares.

The updated FPI sample of products was selected in April 2008. Price collection for the existing and new samples ran alongside each other until June 2008, when collection for the old index ceased.

## **Pricing coverage and timing**

Prices are surveyed in 15 urban areas: Whangarei, Auckland, Hamilton, Tauranga, Rotorua, Napier-Hastings, New Plymouth, Wanganui, Palmerston North, Wellington, Nelson, Christchurch, Timaru, Dunedin, and Invercargill.

Fresh fruit and vegetable prices are surveyed weekly, and the remaining food prices are generally surveyed between the 8th and 16th of the month, although sometimes surveying starts and finishes earlier or later.

## **Expenditure weights**

The main source of information used to weight the FPI basket is the 2006/07 Household Economic Survey (HES), which collected detailed information on the spending patterns of about 2,600 households. However, because the HES doesn't provide accurate information for some food items, such as confectionery and soft drinks, information was also sourced from food manufacturers and distributors, and from supermarket scan data (from the Nielsen Company).

The initial weights for the year to June 2007 (the weight reference period) were 'price updated' to the June 2008 month (the price reference period). This updating involved expressing the underlying quantities of the weight reference period in the prices of the price reference period. The initial weights indicated that households spent \$13.263 billion on food during the year to June 2007 (2006/07). When the food consumed during 2006/07 is expressed in prices that were current at June 2008, that spending rises to \$14.583 billion (10.0 percent higher, due to increased food prices since 2006/07).

Table 4 (in the tables section) gives the expenditure weights, as at the June 2008 month, for the reweighted FPI. It shows that about \$21 of every \$100 spent by households on food is spent on eating out or takeaways. About \$17 of every \$100 spent on food is on meat, poultry, and fish, and about \$14 is on fruit and vegetables. Non-alcoholic beverages such as coffee, soft drinks, and fruit juice account for \$10, and the remaining \$38 is spent on grocery food.

## **Regional population weights**

Regional population weights are used to allocate the national expenditure weights of goods and services derived from the Household Expenditure Survey (HES) and other sources to the FPI pricing centres. For example, the population weights ensure that a given price change in Auckland, with a population weight of 32.98 percent, would have nearly three times the effect on the national FPI than the same movement in Christchurch, which has a population weight of 11.55 percent.

The population weights, which appear in table 5, have been calculated by making use of local government boundaries. The 2008 weights were derived by assigning the census usually resident population as at June 2007 of each regional council area to the pricing centre(s) within the region.

For three regional council areas, Bay of Plenty, Manawatu-Wanganui, and Canterbury, there are two pricing centres in each region. The proportion of the regional council area population allocated to each pricing centre was based on the population of the pricing centre's territorial authority.

The four regions without a pricing centre had their populations allocated to the nearest pricing centres. The Gisborne region's population was allocated to the Napier-Hastings pricing centre, and the Marlborough, Tasman, and West Coast regions were allocated to the Nelson pricing centre.

The population weights used previously were based on the census usually resident population as at June 2005.

As well as allocating population weights to the 15 FPI pricing centres, Statistics New Zealand is also publishing the FPI and CPI for five broad regions based on regional council area boundaries. These regions are Auckland, Wellington, Rest of North Island, Canterbury, and Rest of South Island. The population weights of these broad regions are also given in table 5.

## Elementary aggregate formulae

Regional elementary aggregates are calculated for each of the 15 pricing centres from all prices collected for an item within that region. Regional elementary aggregates are calculated using a 'geometric mean of price relatives', or Jevons formula.

The Jevons formula is used to calculate average prices for all food goods and services in the basket, except for fresh fruit and fresh vegetables. The Jevons formula assumes that households spend the same amount at each surveyed outlet in each period. This implies that increased quantities are purchased from outlets showing lower-than-average relative price change and decreased quantities from outlets showing higher-than-average price change.

The Jevons formula is:

$$P_{JE} = \prod_{n=1}^N \left( \frac{P_n^1}{P_n^0} \right)^{\frac{1}{N}}$$

Where:

$P_n^1$  = Price of item n (n=1...N) in period 1

$P_n^0$  = Price of item n (n=1...N) in the base period

In practice, Statistics NZ uses a weighted geometric mean formula, with the weights, where available, representing the relative importance of outlet types such as supermarkets relative to convenience stores and the relative importance of individual outlets (eg supermarket chains).

As four or five prices (depending on how many Fridays fall within a given month) are collected within each month for fresh fruit and vegetables, the 'arithmetic mean of price relatives' or Dutot formula is used, as the first stage of aggregation is across both outlets within each region and across weeks within each month.

The Dutot formula is:

$$P_{DU} = \sum_{i=1}^N \left( \frac{1}{N} \right) P_i^1 / \sum_{i=1}^M \left( \frac{1}{M} \right) P_i^0$$

Where:

$P_i^1$  = Price of item i (i=1...N) in period 1

$P_i^0$  = Price of item i (i=1...M) in the base period

In practice, Statistics NZ uses a weighted arithmetic mean formula, with the weights, where available, representing the relative importance of outlet types such as supermarkets relative to convenience stores, and the relative importance of individual outlets (eg supermarket chains).

## Average prices of selected food items (table 3)

Table 3 contains a selection of average retail prices for the current and previous month. The weighted average prices are calculated by applying index movements to weighted average prices calculated for the June 2006 month. The weighted average prices are not statistically accurate measures of average transaction price levels, but do provide a reliable indicator of percentage changes in prices.

As the weighted average prices are calculated from the prices as at the June 2006 month, these are not strictly comparable with weighted average prices published before the July 2006 month (when the new June 2006 weighted average price based on the June 2006 sample of prices was published). Further, other methodological changes that will cause the weighted average prices based on the June 2006 average prices to differ from the previously published ones include:

- the adoption of the geometric mean formula for all food goods and services, other than fresh fruit and vegetables
- an updated relative importance of sampled outlet types (eg supermarkets and convenience stores) and sample outlets (eg supermarket chains)
- an updated mix of surveyed brands, varieties, and sizes
- the changes that have been made in the reference size in the 'unit' column of table 3 for some items.

For any given set of prices, the use of the geometric mean formula will result in prices being less than or equal to an arithmetic mean price. This means that the June 2006 month average prices in table 3 for items other than fresh fruit and vegetables are in many cases lower than those that appeared in the June 2006 Hot Off the Press.

## **Seasonal effects – fresh fruit and vegetables**

Until the June 2006 month, fresh fruit and vegetable items that exhibited a seasonal pattern were adjusted to remove the effect of normal seasonal change. This treatment was used to reduce the influence of normal seasonal price fluctuations. However, the treatment did not completely eliminate the effects of seasonal fluctuations if shifts in seasonal patterns occurred.

From the July 2006 month onwards, the FPI incorporates seasonally unadjusted prices for fresh fruit and vegetables. This change is in line with a recommendation made by the 2004 CPI Revision Advisory Committee.

The ongoing, fully unadjusted FPI is linked at the June 2006 month to the previously published FPI, which is partly seasonally adjusted. As such, annual movements calculated over the annual period encompassing the June 2006 month were based on fully unadjusted index numbers for the latest month, compared with partly adjusted index numbers for the same month of the previous year.

During the year-long transition of the official FPI, two sets of index numbers were supplied in table 3 of the FPI release: the index numbers for the FPI which were seasonally adjusted until the June 2006 month (the official FPI series) and the fully seasonally unadjusted analytical series which go back to the June 1999 month.
