

Embargoed until 10:45am – 10 December 2009

Overseas Trade Indexes (Prices): September 2009 quarter (provisional)

Highlights

- The merchandise terms of trade fell 1.3 percent.
- Merchandise export prices fell 5.2 percent and import prices fell 3.9 percent.
- The services terms of trade rose 9.8 percent.
- Services export prices fell 1.5 percent and import prices fell 10.3 percent.

Commentary

Merchandise

Terms of trade

The merchandise terms of trade fell 1.3 percent in the September 2009 quarter, due to export prices (down 5.2 percent) decreasing more than import prices (down 3.9 percent). The terms of trade index is at its lowest level since the December 2005 quarter. The latest quarterly fall followed decreases of 9.4 percent in the June 2009 quarter and 2.7 percent in the March 2009 quarter. In the year to the September 2009 quarter, the merchandise terms of trade index fell 13.8 percent, compared with increases of 5.8 percent and 8.4 percent in the years to the September 2008 and 2007 quarters, respectively.

The latest quarterly fall in the merchandise terms of trade means that in the September 2009 quarter, 1.3 percent less merchandise imports could be funded by a fixed quantity of merchandise exports than in the June 2009 quarter.

Export prices

The merchandise export price index fell 5.2 percent in the September 2009 quarter, and is now at its lowest level since the June 2007 quarter. This was the third consecutive quarterly fall, following decreases of 11.9 percent and 7.9 percent in the June 2009 quarter and the March 2009 quarter, respectively. All of the export price indexes included in the tables attached to this release fell in the latest quarter, except for aluminium. The appreciation of the New Zealand dollar had a downward influence on total export prices in the latest quarter. The Reserve Bank Trade Weighted Index (TWI) increased 7.2 percent in the September 2009 quarter.

The food and beverages index (down 7.2 percent) made the most significant contribution to the overall fall in the export price index in the September 2009 quarter, compared with falls of 14.8 percent in the June 2009 quarter and 8.1 percent in the March 2009 quarter. Dairy products (down 10.4 percent) and meat (down 3.2 percent) were the major drivers to the latest quarterly fall in the index. In the year to the September 2009 quarter, the food and beverages index fell 22.6 percent, compared with a 30.0 percent rise in the year to the September 2008 quarter. The latest annual fall was the largest since the series began in the September 1971 quarter.

The dairy products index fell 10.4 percent in the September 2009 quarter, following falls of 24.1 percent in the June 2009 quarter and 19.9 percent in the March 2009 quarter. Price decreases for milk powder (down 10.7 percent), cheese (down 12.3 percent), and butter (down 6.0 percent) were the main contributors to the latest quarterly fall in the dairy products index. In the year to the September 2009 quarter, the dairy products index fell 42.5 percent, compared with a 44.7 percent rise in the year to the September 2008 quarter. The latest annual fall was the largest since the series began in the March 1950 quarter.

The non-food manufactured goods index (down 5.5 percent) also made a significant contribution to the decrease in the total export price index. The latest fall followed decreases of 9.4 percent in the June 2009 quarter and 4.9 percent in the March 2009 quarter. Price falls for casein (down 22.9 percent), and iron and steel (down 7.1 percent) contributed to this decrease. An increase in prices for aluminium (up 6.9 percent) partly offset these decreases. In the year to the September 2009 quarter, the non-food manufactured goods index fell 16.5 percent, compared with an increase of 14.1 percent in the year to the September 2008 quarter.

Selected Merchandise Export Price Indexes

Quarterly

Base: June 2002 quarter (=1000)

The petroleum and petroleum products index rose 27.8 percent in the September 2009 quarter, following three consecutive quarterly falls. The latest quarterly rise followed falls of 1.9 percent and 28.0 percent in the June 2009 and March 2009 quarters, respectively. The rise in the latest quarter was driven by higher export prices for crude oil. In the year to the September 2009 quarter, the petroleum and petroleum products index fell 38.2 percent, compared with a 65.9 percent rise in the year to the September 2008 quarter.

In the year to the September 2009 quarter, the merchandise export price index fell 21.2 percent, which was the largest since a 23.1 percent decrease in the year to the June 1958 quarter. The latest annual fall followed a rise of 25.0 percent in the year to the September 2008 quarter and a 1.9 percent fall in the year to the September 2007 quarter.

Import prices

The merchandise import price index fell 3.9 percent in the September 2009 quarter, and now is at its lowest level since the June 2008 quarter. The latest quarterly fall was the third consecutive fall, following decreases of 2.8 percent in the June 2009 quarter and 5.4 percent in the March 2009 quarter. The appreciation of the New Zealand dollar against our major trading partners' currencies made a significant contribution to the fall in import prices. According to exchange rates provided by the New Zealand Customs Service for valuing imports, the trade weighted index of the New Zealand dollar rose 8.7 percent in the September 2009 quarter. All of the commodity-based index series included in the tables attached to this release fell this quarter, with the exception of petroleum and petroleum products.

The major contributions to the overall fall in import prices in the September 2009 quarter came from the mechanical machinery index, the non-fuel crude materials index, and the chemicals and related products index.

In the September 2009 quarter, the mechanical machinery index fell 11.3 percent, following a fall of 5.1 percent in the June 2009 quarter and a rise of 8.2 percent in the March 2009 quarter. The latest quarterly fall was the largest since an 11.5 percent decrease in the March 2003 quarter. Price falls for portable computers and computer peripheral equipment contributed to this quarter's fall. (Computer-related producer price indexes from the United States are used as a proxy to measure price change for imported computers. The United States indexes are exchange rate adjusted, and the appreciation of the New Zealand dollar against the United States dollar in the latest quarter had an impact on the decrease in computer prices.) Despite the latest quarterly fall, the mechanical machinery index rose 7.6 percent in the year to the September 2009 quarter. This compared with decreases of 1.7 percent and 17.1 percent in the years to the September 2008 and 2007 quarters, respectively.

The non-fuel crude materials index fell 26.9 percent in the September 2009 quarter, compared with an increase of 21.9 percent in the June 2009 quarter and a decrease of 39.1 percent in the March 2009 quarter. Significant price decreases for calcium phosphates were the main driver of the fall in this index. Other price falls were recorded for synthetic staple fibres and vegetable oils. In the year to the September 2009 quarter, the non-fuel crude materials index fell 37.9 percent – the largest annual fall since the series began in the September 1971 quarter. The latest annual fall compared with an 83.0 percent increase in the year to the September 2008 quarter, and a 5.9 percent decrease in the year to the September 2007 quarter.

Selected Merchandise Import Price Indexes Quarterly

Base: June 2002 quarter (=1000)

The chemicals and related products index showed a fall of 5.2 percent in the September 2009 quarter, following decreases of 7.9 percent in the June 2009 quarter and 3.6 percent in the March 2009 quarter. The latest quarterly fall was mainly driven by price decreases for inputs for fertilisers, and for plastic plates of polymers of ethylene (such as plastic food wrap). The chemicals and related products index also recorded an annual fall in the year to the September 2009 quarter, down 11.5 percent. This annual fall, which was the largest since the March 1990 quarter, compared with a rise of 19.4 percent in the year to the September 2008 quarter and a fall of 7.1 percent in the year to the September 2007 quarter.

The petroleum and petroleum products index rose 16.9 percent in the September 2009 quarter following three consecutive quarterly falls, and contributed the main offsetting effect to the overall fall in import prices. The latest quarterly increase compared with falls of 1.0 percent in the June 2009 quarter and 35.6 percent in the March 2009 quarter. The rise in the latest quarter was primarily influenced by higher crude oil prices (up 23.9 percent), and increases for motor spirit and automotive diesel. The petroleum and petroleum products index fell 42.0 percent in the year to the September 2009 quarter. This was the largest annual fall since the September 1986 quarter, and compared with an increase of 66.1 percent in the year to the September 2008 quarter and a decrease of 11.5 percent in the year to the September 2007 quarter.

Excluding petroleum and petroleum products, import prices fell 7.3 percent in the September 2009 quarter.

In the year to the September 2009 quarter, the total imports price index fell 8.6 percent, compared with an 18.2 percent rise in the year to the September 2008 quarter and a 9.5 percent fall in the year to the September 2007 quarter.

Import Prices by Broad Economic Category

Quarterly

Base: June 2002 quarter (=1000)

Imports by broad economic category

All three broad economic categories recorded price falls in the September 2009 quarter. A 6.4 percent fall in the consumption goods index was the major contributor to the 3.9 percent fall in the total import price index. Falls of 7.1 percent in the capital goods index and 2.7 percent in the intermediate goods index also made significant contributions to the overall fall.

The consumption goods index fell 6.4 percent in the September 2009 quarter – the largest quarterly fall since the series began in the September 1989 quarter. This fall followed a fall of 4.1 percent in the June 2009 quarter and a rise of 7.9 percent in the March 2009 quarter. The latest quarterly fall in this index was mainly influenced by the semi-durable goods sub-index (down 9.0 percent), which was primarily due to price falls for clothing and footwear items, and the non-durable goods sub-index (down 5.7 percent).

The capital goods index also fell (down 7.1 percent) in the September 2009 quarter, and was the largest quarterly fall since the March 2003 quarter. This quarter's fall followed a 5.2 percent decrease in the June 2009 quarter and an 8.8 percent increase in the March 2009 quarter. The fall in the latest quarter largely came from a 7.2 percent fall in the non-transport equipment sub-index, including price falls for tractors, computers, and computer accessories (such as storage devices).

In the September 2009 quarter, the 2.7 percent fall in the intermediate goods index followed three consecutive quarterly falls. Six out of eight published sub-indexes recorded decreases. The latest quarter's fall primarily came from a 6.9 percent fall in the processed industrial supplies sub-index, mainly driven by price decreases for inputs for fertilisers, and for plastic plates of polymers of ethylene (such as plastic food wrap). The primary fuels and lubricants sub-index (up 23.4 percent, due to higher crude oil prices) provided a partly offsetting rise.

Services

Terms of trade

The terms of trade for services rose 9.8 percent in the September 2009 quarter, which was the largest quarterly increase since the series began in the June 1997 quarter. The current quarter's rise followed a 3.8 percent increase in the June 2009 quarter and a 2.3 percent decrease in the March 2009 quarter. The latest quarterly rise was due to services export prices (down 1.5 percent) falling less than services import prices (down 10.3 percent). In the year to the September 2009 quarter, the terms of trade for services rose 4.2 percent, compared with a decrease of 3.6 percent in the year to the September 2008 quarter and an increase of 10.8 percent in the year to the September 2007 quarter.

Export prices

Services export prices fell 1.5 percent in the September 2009 quarter, following a fall of 3.3 percent and a rise of 0.5 percent in the June 2009 quarter and March 2009 quarter, respectively. The transportation index (down 6.0 percent) made the largest contribution to the overall fall in services export prices in the latest quarter.

In the year to the September 2009 quarter, the services export price index fell 1.3 percent, following a 7.2 percent rise in the year to the September 2008 quarter. The latest annual fall was the first since a 0.8 percent decrease in the year to the March 2004 quarter.

Import prices

Services import prices fell 10.3 percent in the September 2009 quarter, following a fall of 6.9 percent in the June 2009 quarter and a rise of 2.9 percent in the March 2009 quarter. The latest quarterly decrease was the largest since the series began in the June 1997 quarter. The main contribution to the overall fall in services import prices was from the transportation index (down 19.7 percent), mainly driven by the sea freight sub-index.

In the year to the September 2009 quarter, the services import price index fell 5.3 percent, compared with a rise of 11.3 percent in the year to the September 2008 quarter and a fall of 8.2 percent in the year to the September 2007 quarter.

Exchange rate movements

According to the exchange rates published by the Reserve Bank of New Zealand, the trade weighted index (TWI) of the New Zealand dollar rose 7.2 percent in the September 2009 quarter. In this quarter, the New Zealand dollar appreciated against our five major trading partners' currencies. The greatest appreciation was against the United States dollar (up 11.9 percent), followed by a 7.5 percent appreciation against the Japanese yen.

Exchange rates used in the calculation of merchandise import values differ from the weekly exchange rates used in the calculation of merchandise export values. Import values are converted from foreign currencies using exchange rates set by the New Zealand Customs Service (NZCS) every two weeks. These exchange rates are prepared 11 days before the effective date and are then applied for two weeks. Therefore, the NZCS rates of exchange lag from 11 to 25 days compared with exchange rates published by the Reserve Bank.

Merchandise Trade Indexes⁽¹⁾ and Average Trade Weighted Index⁽²⁾
Quarterly

(1) Base: June 2002 quarter (=1000).
(2) Base: June 1979 month (=100).

Services Trade Indexes⁽¹⁾ and Average Trade Weighted Index⁽²⁾
Quarterly

(1) Base: June 1997 quarter (=1000).
(2) Base: June 1979 month (=100).

For the September 2009 quarter, the NZCS TWI recorded an 8.7 percent rise, with the New Zealand dollar rising against our five major trading partners' currencies. The appreciation of the New Zealand dollar has a downward influence on both import and export prices in New Zealand dollars. The impact on the terms of trade depends on the relative exchange effect on exports and imports.

Exchange Rates New Zealand Customs Service					
	USA (NZ\$:US\$)	UK (NZ\$:pound)	Australia (NZ\$:A\$)	Japan (NZ\$:yen)	EU (NZ\$:euro)
Change from June 2009 quarter (%)	13.4	3.8	1.7	10.3	7.9

Updates to previously published material

The overseas merchandise trade indexes are provisional for one quarter to allow for receipt and editing of late and amended trade documentation.

June 2009 Quarter Overseas Trade Indexes (Prices)

Provisional June 09	1033	957	1079
Published on 10 December 2009			
Final June 09	1029	958	1074

For the June 2009 quarter, the final merchandise export price index number was 4 index points lower than the provisional index number. This was mainly due to the inclusion of more up-to-date merchandise trade source data for the forestry products index.

Next release ...

Overseas Trade Indexes (Prices): December 2009 quarter (provisional)
and
Overseas Trade Indexes (Volumes): December 2009 quarter (provisional)
will both be released on 10 March 2010.

Technical notes

Definitions

capital goods	Produced assets used repeatedly or continuously (for longer than one year) in industrial production processes. Examples are machinery, trucks, and aircraft.
consumption goods	Goods used (without further transformation in industrial production processes) by households, government, or non-profit institutions serving households. – durables have an expected usage of three years or more, eg appliances, furniture. – semi-durables have an expected usage of one or two years, eg linen, shoes, toys. – non-durables have an expected usage of less than a year, eg soap, yarns, books.
fob	Free on board (the value of goods at New Zealand ports before export, which includes the cost of the goods plus the cost (including loading charges) of putting them on a vessel or aircraft).
government services (exports)	Includes sales of capital assets excluding land, estimated expenditure of foreign embassies in New Zealand, the portion of the government's international aid spent in New Zealand, and the government's receipts from immigration fees.
government services (imports)	The operational expenses of New Zealand's embassies overseas, and the costs of the New Zealand defence forces stationed overseas.
intermediate goods	Goods used up or transformed in industrial production processes.
merchandise trade	Exports or imports of goods that increase or decrease the stock of material resources in New Zealand. Includes goods leased for a year or more.
other services	Services other than transportation, travel, and government services. Examples are insurance, royalties and licence fees, banking and financial services, computer and information services, telecommunications, and personal, cultural, and recreational services.

re-exports	Exported goods that were earlier imported into New Zealand and include less than 50 percent New Zealand content by value.
transportation	The international carriage of goods and passengers. Includes freight, airfares, port services, and stevedoring.
travel (exports)	The expenditure of overseas visitors while travelling in New Zealand, and the expenditure by international students in New Zealand.
travel (imports)	The expenditure of New Zealanders while travelling overseas.
vfd	Value for duty (the value of imports before insurance and freight costs are added).

What the price indexes measure

These indexes are numerical series that indicate how a set of prices has changed between time periods. Each index measures changes in the level of prices rather than the actual prices. It is the change between two index numbers that is important. An individual index number has no meaning.

The overseas merchandise trade price indexes measure changes in the price levels of imports and exports of merchandise trade to and from New Zealand, on both a quarterly and an annual basis. The overseas services trade indexes measure changes in price levels of services to and from New Zealand on a quarterly basis.

Price measurement relates to the decomposition of transaction values in current prices into their price components. In principle, the price components should include changes arising solely from price changes, while all other changes (relating to quantity, quality and compositional changes) should be included in the volume components.

Time of recording

The merchandise price indexes in this release are calculated from the same data as that used in the [Overseas Merchandise Trade: October 2009](#) Hot Off The Press published on 27 November 2009. Updates published after these dates are not included.

Merchandise price indexes are provisional for one quarter, to allow for the inclusion of late data and amendments to the merchandise trade source data. Merchandise figures in this release that relate to the June 2009 quarter are based on later data than that which was available for the previous overseas trade indexes release (for the June 2009 quarter), published on 10 September 2009.

The price indexes for services are final figures (unlike the merchandise series, which are first published as provisional figures). The services indexes are revised only for significant errors. An exception is when lagged prices are used in new indexes and are later replaced by current prices. Revisions are notified by an R beside the revised number in the release table.

Source of information – merchandise trade

Value and quantity data used for calculating the merchandise price indexes are derived from Statistics New Zealand's overseas merchandise trade statistics, which are in turn processed from export and import entry documents lodged with New Zealand Customs Service (NZCS) by exporters, importers and their agents.

Data is classified using the Harmonised System (HS) classification for processing NZCS entries and publishing overseas trade statistics. There are over 18,600 10-digit items in the HS classification.

HS 10-digit item by country unit values are derived from Statistics NZ's overseas trade statistics. Quarterly item by country unit values are calculated by dividing the total value of an HS item exported or imported during the quarter by the total quantity of the item exported or imported during the quarter. These unit values are then extensively edited, with outliers removed before being used in trade index calculations.

For basic, homogeneous commodities not subject to ongoing quality change, unit values provide suitable indicators of price change. However, unit values do not provide good indicators of price change for heterogeneous goods such as elaborately transformed goods, technically complex goods, or goods subject to rapid quality change. Unit values have been selectively supplemented with prices collected directly from importers and exporters, and by international price indexes.

Directly surveyed prices

Prices are collected directly from importers and exporters for selected goods that are regularly imported or exported in the same form to the same or similar specification. These items may not have a specified unit of quantity, or may fall under an HS code with a heterogeneous description.

Directly surveyed prices are collected from importers and exporters via the existing Commodity Price Survey used for the producers price index.

Directly surveyed prices were first collected in the June 2002 quarter, so they contribute to movements for the September 2002 and subsequent quarters.

The process of adding to the pool of directly surveyed prices is an ongoing one and is part of the overseas merchandise trade index quality assurance programme.

International price indexes

International price indexes are used selectively as a proxy to measure price change faced by importers for goods that are irregularly imported (for example, public transport equipment), imported to one-off specifications (for example, telephonic and telegraphic apparatus), and technically complex goods subject to rapid quality change (for example, computer equipment).

The following table lists the areas of the HS classification where international price indexes have been used, and the type of index selected as a proxy for change in prices faced by New Zealand importers. Most use has been made of the US producer price index (PPI), with some use of the US HS export price index (EPI). In both cases, monthly international price index numbers have been converted to quarterly index numbers and then exchange-rate adjusted using the NZCS rates of exchange.

The following table lists the main goods for which international price indexes are currently used in the import indexes.

Goods Using International Price Indexes		
HS chapter	Goods	International price index
84	Mechanical machinery	
	Printing machinery	US producer price index
	Computer equipment	US producer price index
	Computer and office equipment parts and accessories	US producer price index
85	Electrical machinery	
	Telephonic and telegraphic apparatus	US HS export price index
	Cellular phones	US producer price index
	Radio-telephonic parts	US HS export price index
86	Railway equipment	US producer price index
87	Vehicles other than railway equipment	Minor use of US HS export price index
88	Aircraft	US producer price index
89	Ships	US producer price index

The US PPI indexes used for computer equipment, parts and accessories are compiled using hedonic quality adjustment techniques designed to remove the effect of quality improvements and isolate pure price change. The US PPI indexes for computer equipment, parts and accessories used in the imports price index are lagged one quarter, to reflect a potential delay from the time new technology is available domestically in the US to the time it is imported into New Zealand. The US computer indexes used in the merchandise imports price index, and the one-quarter lag, are both broadly in line with the approach that has been used for some time for quarterly constant price imports in gross domestic product.

Adjustment to unit values for imported cars

The calculation of price movements for the main HS 10-digit item codes for cars differs from the unit value calculation used for other items in the overseas trade indexes. The used-car codes have previous June quarter and current quarter unit values calculated for each year of manufacture, and the new car codes have unit values calculated for each of the main makes of car recorded under the codes. Movements in these unit values are weighted by the value of cars imported, for each year of manufacture (used cars) and make of car (new cars), to give Paasche, Laspeyres and Fisher indexes at the HS 10-digit item by country level.

The method was introduced in the June 2002 quarter, to reduce the effect of new frontal impact standards on the age distribution of used-car imports. The new standards reduced the number of pre-1996 used cars being imported.

The dollar value of the car items treated in this way accounted for 8.9 percent of the total dollar value of imports in the year to June 2003.

Imputation

Explicitly priced items are defined as those items displaying reliable unit-value behaviour, those items for which prices are collected directly from importers or exporters, and those items for which international price indexes are used as price indicators. Remaining items have imputed to them price movements of items that are more reliable indicators of a similar type. As Fisher Ideal indexes are calculated at the country grouping level (for the European Union (EU) and the 'Rest of World' (ZZ)), and the HS 10-digit item level for all countries, imputation occurs at up to four levels, as shown in the following table.

Imputation Procedures				
Type of index	First level	Second level	Third level	Fourth level
HS10 country grouping (EU, ZZ)	Remainder of index			
HS10 item	HS10 country grouping (EU, ZZ)	Remainder of index		
HS2 chapter	HS10 country grouping (EU, ZZ)	HS10 item	Remainder of index	
Standard or broad economic category (BEC) index	HS10 country grouping (EU, ZZ) index	HS10 item	HS chapter or part chapter	Remainder of index

'Base annual imputation rates' represent the dollar value, in the previous June year of the index's imputed items, as a percentage of the index's total dollar value for the previous June year. For the September 2009 quarter, there was a base annual imputation rate of 20.6 percent for exports and 37.9 percent for imports.

Source of information – services trade

Value data used in calculating the weights for the service indexes is derived from Statistics NZ's balance of payments data, which is in turn processed from various surveys operated by the Balance of Payments business unit. New weights were implemented in the September 2009 quarter, using balance of payments data for the year ended June 2009.

Pricing information used for calculating the indexes is obtained from Statistics NZ's Commodity Price Survey. The Commodity Price Survey collects prices for approximately 13,000 individual items. The prices are collected by postal survey from about 3,000 respondents and from international price indexes. Prices are generally collected each quarter, with the price on the 15th of the middle month of the quarter measured for domestic prices. Prices may be obtained quarterly or annually depending on the nature of the item. For the import services indexes, much of the pricing is from international price indexes. The collection of these prices (index numbers) depends on the frequency and timeliness of their publication. If they are published monthly, the middle month of the quarter is used; however, in some cases the prices are lagged a month or a quarter if the value for the relevant period is not available in time.

Basis of valuation

The merchandise export indexes are calculated using New Zealand dollar free on board (fob) values. Export fob values represent actual or estimated transaction prices of goods, including

costs incurred in delivering goods on board ships and aircraft at New Zealand ports of export. Values given in foreign currencies are converted by Statistics NZ into New Zealand dollars using weekly exchange rates when the statistics are compiled. This means that any hedging will generally not be reflected in the merchandise import and export price indexes.

The merchandise import indexes use New Zealand dollar vfd values (the value of goods excluding the cost of freight and insurance). Prior to the September 2003 quarter, the merchandise import indexes used cif values, which represented the value of goods plus the insurance and freight costs associated with bringing the goods to New Zealand ports of entry. The vfd valuation for imports is recommended in the System of National Accounts 1993 and is used in the New Zealand national accounts.

Vfd values are converted from foreign currencies when import documents are processed by NZCS. The NZCS exchange rates are prepared 11 days prior to the effective date and are then applied for two weeks. Therefore, the exchange rate used in the imports prices will be 11 to 25 days old when it is used in imports documentation. This means that the NZCS exchange rate, and therefore the imports prices, will be slower to show the impact of changes in the exchange rate than the Reserve Bank rates and the export prices.

Merchandise import price indexes are not directly affected by changes in the rates of duty payable on imported goods, as vfd values do not include duty. Therefore, the phased reduction in tariffs that has occurred in recent years has not had a direct downward influence on the import price indexes.

The services price indexes use New Zealand dollar values for both exports and imports. Exchange rates used in the calculation of the services indexes differ from those used for the merchandise indexes. Prices collected in foreign currencies are converted using the exchange rate supplied by Westpac Bank for the 15th day of the middle month of the quarter for the relevant currencies. The foreign currencies used in the services indexes are the US dollar, Australian dollar, Fijian dollar, Japanese yen, and the United Kingdom pound.

Index coverage

The merchandise trade indexes include all commodities classified as merchandise trade, although the export indexes exclude re-exports, bunkering (re-fuelling the vessels), ships' stores and passengers' effects.

The System of National Accounts 1993 provides the conceptual base for the services indexes. It establishes the range of services that should be included in the indexes, and key practices, for example the treatment of insurance.

Index type and calculation

Merchandise trade

The merchandise index series are of the chain-linked Fisher Ideal type. The calculation of a Fisher Ideal index involves first calculating two indexes. One, the Laspeyres, is base-weighted and uses expenditures from an earlier period to weight price or volume movements. The other, the Paasche, is current-weighted and uses expenditures from a current period to weight price or volume movements. The Laspeyres and Paasche indexes are then averaged by calculating the geometric mean (that is, the square root) of the two indexes to give the Fisher Ideal index. In the majority of situations covered by index numbers, price and quantity changes are negatively

correlated. In such cases, Laspeyres indexes tend systematically to record greater increases than Paasche indexes, with the gap between them tending to widen over time.

The merchandise index series have a June quarter price reference period, and are linked to the index for the June quarter of each year. There are annual expenditure weight reference periods for both the Laspeyres (previous June year) and Paasche (year to each quarter) components of the index.

The price index methodology involves:

1. calculating Laspeyres and Paasche price indexes for the current quarter on the previous June quarter
2. calculating Fisher Ideal price indexes for the current quarter on the previous June quarter (as the geometric mean, or square root, of the Laspeyres and Paasche price indexes calculated in step 1)
3. linking the Fisher Ideal price index for the current quarter (calculated in step 2) to the index for the previous June quarter, to provide a continuous quarterly time series.

The Laspeyres and Paasche volume indexes for the current quarter, based on the previous June quarter, are calculated by deflating the change in dollar value from the previous June quarter to the current quarter by the Paasche and Laspeyres price indexes, respectively (calculated in step 1 above). Steps 2 and 3 are repeated as above, using volume (rather than price) indexes.

The annual price indexes are calculated as volume index-weighted averages of the four component quarter price indexes, and the annual volume indexes as the simple average of the four component quarterly volume indexes.

Expenditure weights are assigned at the HS 10-digit item by country level. Item and index weights are not fixed. They vary from quarter to quarter and from year to year as the relative values of goods New Zealand exports and imports change.

Services trade

The services indexes are an annually chain-linked Laspeyres price index series. The weights are determined by the relative importance of services and businesses within the service industry. Information from various surveys, censuses and other sources is used to determine the weights.

Expression base

The merchandise index series expression base is the quarter ended June 2002 (=1000).

The merchandise terms of trade index expression base is the quarter ended June 2002 (=1000).

The services price indexes expression base is the quarter ended June 1997 (=1000).

The services terms of trade index expression base is the quarter ended June 1997 (=1000).

Trend estimates – merchandise trade

Time series can be split into trend, seasonal and irregular components. Seasonal adjustment removes the seasonal component, while trend estimation removes the seasonal and irregular components. Trend estimates reveal the underlying direction of movement in a series and are used to identify turning points.

The merchandise terms of trade trend series is calculated using X-12-ARIMA, which adjusts for outlying values and uses a centred moving average. The length of the centred moving average is

selected automatically and can be 9, 13 or 23 months, depending on the relative variability of the irregular component compared with the trend. A long moving average has the effect of smoothing the trend series but slowing the response to underlying changes in growth rates, while a short moving average produces a trend series that is less smooth but quicker to identify turning points.

Trend estimates are recalculated each quarter. The use of new quarterly data means that previously published trend estimates are subject to revision. Revisions can be particularly large if an observation is treated as an outlier in one quarter, but is found to be part of the underlying trend as further observations are added to the series. Typically, only the estimates for the most recent quarters will be subject to substantial revisions.

What the overseas terms of trade index measures

The overseas terms of trade index measures the changing volume of merchandise imports that can be funded by a fixed volume of New Zealand's merchandise exports.

How the terms of trade are calculated

The merchandise terms of trade index is calculated as the ratio of the total export price index to the total import price index, and then presented on an expression base of the quarter ended June 2002 (=1000).

The services terms of trade index is calculated as the ratio of the total services export price index to the total services import price index, with the June 1997 quarter used as the expression base.

An index value above (or below) 1000 indicates that the terms of trade are more (or less) favourable than in the base period.

An increase in the terms of trade index indicates that the real purchasing power of exports has increased, while a decrease indicates a drop in the purchasing power of exports.

Effect of exchange rate movements on terms of trade

A decline in the value of the New Zealand dollar has an upward influence on both export and import price levels, and a strengthening of the dollar has a downward impact on prices of both exports and imports. This means that any effect on the terms of trade in either case is likely to be minor and limited to situations where the New Zealand dollar has weakened or strengthened against a particular currency. It is also limited to where there is a significant imbalance in the values of exports and imports transacted in, or with prices determined by, that currency.

Broad economic categories (BEC)

BEC categories are arranged, as far as practicable, to align with the System of National Accounts' three basic classes; namely capital goods, intermediate goods and consumption goods. Commodities in BEC are categorised on the basis of their main end use. This means, for example, that all video recorders are treated as consumption goods even though some are used in business.

When latest results are released

Merchandise provisional indexes are available within 10 weeks of the end of the reference quarter. Final indexes are released within 24 weeks of the end of the reference quarter.

Only final data is released for the services indexes. This data is available at the same time as the provisional merchandise trade indexes.

Contract indexation

Parties that engage in commercial contracts use a range of price indexes produced by Statistics NZ in their indexation clauses (also known as contract escalation clauses). An indexation clause gives both parties a contract with an agreed procedure for adjusting an originally contracted price, to reflect changes in costs or prices during the life of the contract.

Contract indexation: A Guide for Businesses provides information on the price indexes produced by Statistics NZ and issues relating to their use in indexation clauses. The guide also outlines some points to consider when preparing an indexation clause, and includes an example of the mechanics of a simple indexation formula.

Further information

A wider range of index series than is presented in this release is available on Infoshare, Statistics NZ's free online database, or can be provided in other media on request. There are currently 57 export and 55 import merchandise index groupings. There are five export and five import service index groupings available on Infoshare.

For each of the merchandise trade price indexes, there are also related quarterly and annual volume indexes and dollar-value series available.

To access the overseas trade indexes (OTI) time series, go to infoshare at <http://www.stats.govt.nz/infoshare/>, and choose:

Subject category: **Imports and exports**, then choose: **Overseas Trade Indexes – Prices**

More information about infoshare can be found on our website at <http://www.stats.govt.nz/about-infoshare>.

More detailed explanatory notes and a full list of available indexes and related dollar-value series are available on request.
